Alberta Manlift Training

Manlift Training Alberta - There are a lot of manlift training programs that offer a review of the manlift machine. The practicum portion of the training is one more essential part of the course. In this part the trainee has chance to demonstrate their practical abilities, their ability to safely operate a manlift. A prerequisite to Manlift training is the fall protection training, that could be included in the training according to the particular requirements of the client.

Course Content
The program content consists of: the effect of doing unsafe acts or utilizing unsafe equipment, pre-shift equipment inspection and work area survey requirements, Lifting device equipment definitions, Review of load capabilities, safety decals and particular machine requirements, Review of related sections of the OSHA Standards as well as the CSA Standards and Review site specific Hazards, along with controls for safe utilization of a lifting device.

Demonstration and Evaluation Content
Demonstration and evaluation content includes: Utilizing a spotter or a signaler when required; Proper personal protective equipment or likewise referred to as P.P.E. as needed; using a lift only on solid and level ground; Making use of the proper fitting harness or fall arrest device; Operating the lift with all other staff clear of the job place; Aware of load limitations etc. and other specs as set out by the manufacturer; Pre-shift work area survey and equipment check; Having all associated equipment stored safely on the lift platform; Isolating off the work area when major work projects are to be completed; and ensuring a safe and smooth operating speed for various plant conditions

Each of the trainees will undergo testing to make sure that they are able to safely operate their machine.

Manlift Safety
Manlifts could be really dangerous machines as they are capable of lifting a worker 20 feet or higher in the air and that creates a particular amount of danger. Because the danger is so apparent, lift operators and owners are careful to correctly maintain their machinery and follow proper operating procedures and safety measures. The ratio of accidents involving this specific apparatus is quite low.

The safe use of the scissor lift, manlift and the boom lift is up to the operator of that machinery. They need to understand all of the responsibilities that go with operating the equipment and how to utilize the lift vehicle safely. The most basic safety features on the machinery are the operating handbook and safety decals. These show essential information regarding the safety equipment, maintenance and operating procedures.

Newer lift models would come together with instruction manuals and decals in place. Technically, the operating guidebook should be kept on the lift itself. If you are buying a second-hand lift, it is vital to ensure that the handbook is included and that essential decals haven't been painted over. The restraints that prevent operators from falling and the guardrails are other important safety features. These are mandatory and standard on all kinds of lifts.
