Boom Lifts

Boom Lifts Training Alberta - Boom Lifts are a platform lift apparatus that could be raised or lowered to varying heights, making this apparatus a helpful tool for many manufacturing purposes. There are many distinctive types of Boom Lift consisting of knuckle booms, scissor lift trucks, and aerial lifts, each operating differently.

The common aerial lift variation is frequently utilized at skiing lodges to transfer people who are not comfortable using the snowboard lift. Working in a manner similar to that of an elevator, snowboarders are transported up the mountain in stages, stopping at stations along the way until they reach the summit. Aerial hoists are also used in construction, moving personnel safely up and down the sides of multi-level building sites.

Scissor hoists are also in the boom jack category. They are utilized regularly by utility businesses as an ideal system to allow workers to complete upkeep and repair on wires and cables that are attached to poles. Phone, cable television and power providers have relied on the efficiency of this style of boom jack for years.

The knuckle boom lift is built for use within locations of bumpy ground and where the need to reverse direction may be required. This style of boom lift has the capability to fit in tight spots where a scissor jack cannot fit. Working between multiple machines in a production facility or in close proximity between two walls, the knuckle boom additionally features a standard table equipped with rails for security and worker safety.

The type of boom jack needed by companies will often depend on the nature of the work needed. Fortunately, there are suitable models for just about any task.
